

Technical Bulletin #321

STATE OF UTAH CICS WEB ACCESS

Issued: August 28, 2003
Effective: August 28, 2003
Section/Group: CICS Systems Programming
Submitted By: Ted Smith
Approved By: Clair Christensen

Currently, Web access is available to all CICS regions in the State of Utah mainframe Sysplex. The available applications can be seen on the following URL..

<http://itm4.state.ut.us:6401/>

The available applications do not change the existing Mainframe programs. No changes are required if Basic Mapping Support is not used. A default header and footer are available for all transactions, and they can be changed by transaction, if desired.

If Mapping Support is used, all that is required is to recompile the map with the compile procedure, which generates the HTML and a new map for the Web access. If the source for the map does not exist, the source may be regenerated by doing a decompile with a CICS utility, which then may be used to create the HTML and a new map.

Current available applications on the Web have had their maps recompiled with the HTML, and new maps generated. Any existing or new application or system can be added to CICS Web access with no modification to the application for Web access.

A normal CICS sign-on, with mainframe user ID and password, is required to access the existing and future applications.
